

Amendments to the Specification:

Please replace the paragraph on page 13, lines 7-17 with the following amended paragraph:

Stripe type barriers 121 on which a phosphor layer 123 is deposited are formed on the second substrate 120. A plurality of projections 130 are formed between the barriers 121 at constant intervals. At this time, the projections 130 are preferably arranged between the barriers [21] 121 corresponding to the boundary portion between the cells. A top portion at both sides of the projections 130 should be separated from inner sides of the barriers [21] 121. It is preferable that both sides of a lower portion of the projections 130 are separated from the inner sides of the barriers 121. However, both sides of the lower portion of the projections 130 may be mounted in the inner sides of the barriers 121.
